

There is always a reason to smile. Improving smile aesthetics.

What Orthodontists can do to improve Smile Aesthetics with 3D Technology.

The relationship between teeth and their biological environment is key for success when looking at Smile Aesthetics. It is also important to take into consideration the relative position of the root with respect to the supporting alveolar and cortical bone. However, these biological aspects are closely correlated with two other essential keystones of ideal orthodontic objectives: function and aesthetics. During this lecture Dr. Juan Carlos Pérez Varela will analyse the importance of anterior and posterior torque in occlusion, smile aesthetics and biology.

Join 3M for a series of captivating E-xcellere 2022 events that will introduce you to the latest technologies and techniques in orthodontics.
